R. Sitel: Drail (CACCACGT)
R. Sitel: Drail (CACCACGT)
Description: 1st strand cDNA was primed with an oligo(dT) primer (ATGTGGCCTTTTTTTTTTTTTT); double-stranded cDNA was synthesized using specific 5' and 3' primers and amplified by PCR. The PCR product was digested with Sfil and size selection was performed to exclude fragments cd. Skb. The Sfil-digested PCR product was cloned into distinct Drail sites of PME185-FL3. XhoI sites just outside the Drail sites can be used to isolate the CDNA insert. Libraries were constructed by oligo-capping method (Sugano et al.,University of Tokyo, Institute of Medical Science). Custom primer used for sequencing (5' end primer [CGTCTGCTCTAAAAGCTGCG]; 3' end primer [CGACTGGACTGACACA]).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /codol_start=1

Method for screening for type 2 diabetes mellitus comprises detecting polymorphism in a calpain encoding nucleic acid segment or a protease-encoding nucleic acid segment -

Claim 65; Page 219-220; 257pp; English.

The present sequence is that of cDNA corresponding to the major transcript of the human calpain 10 gene, CAPNIO (see AAZ27475), carciuding the polyA tract. The sequence contains an open reading frame that encodes a protein of 672 amino acids (see AAY79567), designated calpain 10a. The CAPNIO gene consists of 15 exons spanning 32 kb. A complex pattern of alternative splicing generates proteins of 672, 544, 517, 513, 444, 274, 139 and 138 amino acids (see AAY79567-74), designated calpain 10a to 10h, respectively. Isoform 10a is encoded by exons 1-7 and 9-13 of the CAPNIO gene. Transcripts encoding calpain 10a are the most abundant in the various tissues examined. The invention concerns the identification of genes responsible for type 2 diabetes for use in diagnostic and therapeutic applications. A G-to-A polymorphism in intron 3 of the CAPNIO gene in the NIDDMI region of chromosome 2 (UCSNP-43) shows evidence for linkage to type 2 diabetes. Claimed methods for screening for a propensity for type 2 diabetes mellitus are based on detection of a polymorphism in a calpain encoding nucleic acid, especially UCSNR-10 of the CAPNIO gene. Methods are also claimed for: producing calpain 10 polypeptides using calpain 10 polypeptides and nucleic acids; and using these modulators to treat diabetes, in particular through the regulation of an insulin

                                                                                                                                                                                derived from OVARNOTO? cDNA library. It encodes human protease and associated protein-13 (PPRG-13), which is expressed in nervous and reproductive tissues. Anti-PPRG antibodies can be used as therapeutic antagonists, reagents for diagnosis and monitoring diseases and for isolating PPRG. PPRG nucleotide sequence can be used as probe or primer for diagnosis and monitoring of PPRG-PPRG nucleotide sequence can be used as probe or primer for diagnosis and monitoring of PPRG-PPRG diseases and gene mapping. PPRG can be used in the treatment of cell proliferative disorders like cancer, arteriosclerosis, atherosclerosis, bursitts, cirrhosis and hepatitis, and immune disorders like AIDS, Addison's disease, adult respiratory distress syndrome, allergies, and provincing and province and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Bandman O,

                                                                                                                                                                                                                                                                                                                    Align seg 1/1 to: AAK94261
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a full length human cDNA of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.

seq\_documentation\_block:
ID AAA27481 standard; cDNA; 2455 BP

The present sequence is that of cDNA corresponding to a minor transcript of the human calpain 10 gene, CAPN10 (see AAZ7475).

The sequence contains an open reading frame that encodes a protein of 174 amino acids (see AAY79572), designated calpain 10f. The capus of 15 exons spanning 32 kb. A complex pattern of 274 amino acids (see AAY79572), designated calpain 10f. The capus of 15 exons spanning 32 kb. A complex pattern of alternative splicing generates proteins of 672, 544, 517, 513, 444, 274, 139 and 138 amino acids (see AAY79567-74), designated calpain 10a to 10b, respectively. Calpain 10f is encoded by exons identification of genes responsible for type 2 diabetes for use in clasmostic and therapeutic applications. A G-to-A polymorphism in clasmostic and therapeutic applications. A G-to-A polymorphism in clasmost of the CAPN10 gene in the NIDDM1 region of chromosome 2 (UCSNP-43) shows evidence for linkage to type 2 diabetes are methods for screening for a propensity for type 2 diabetes are methods for screening for a propensity for type 2 diabetes are also cald, especially UCSNP-10 of the CAPN10 gene. Methods are also cald, especially UCSNP-10 of the CAPN10 gene. Methods are also cald, especially UCSNP-10 of the CAPN10 gene. Methods are also didentifying modulators of calpain activity using calpain 10 cencoding polynucleotides, including the present sequence; dentifying modulators of calpain activity using calpain 10 centors and activity using calpain 10 centors activity using calpain 10 centors and activity using calpain 10 centors and activity using calpain 10 centors activit Zhou Y, Otani K; Method for screening for type 2 diabetes mellitus comprises of polymorphism in a calpain encoding nucleic acid segment or a protease-encoding nucleic acid segment. polypeptides and nucleic acids, and using these modulators treat diabetes, in particular through the regulation of an NIDDM1; non-insulin-dependent diabetes mellitus; CAPNIO calpain 10; calpain 10f; diapain-1; cysteine protease; chromosome 2; human; diagnosis; therapy; ss. secretory response or insulin mediated glucose transport. many tissues, including skeletal muscle and islets. The invention concerns the identification of genes responsible for type 2 diabetes for use in diagnostic and therapeutic applications. A c-to-A polymorphism in intron 3 of the CAPNIO gene in the NIDDMI region of chromosome 2 (UCSNP-43) shows evidence for linkage to type 2 diabetes. Claimed methods for screening for a propensity for type 2 diabetes are based on detection of a polymorphism in a calpain conding nucleic acid, especially UCSNP-10 of the CAPNIO gene. Methods are also claimed for producing calpain 10 polypeptides wising calpain 10-encoding polymorlectides, including the present sequence: identifying modulators of calpain activity using calpain 10 polypeptides and nucleic acids; and using these modulators to treat diabetes, in particular through the regulation of an insulin secretory response or insulin mediated glucose transport.
    It is readily detectable in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  92 CGCCTTCCCCGCCGCGGGACTCCTCGCCTCTTCTGCGACTTGTCTACGCGC 141

```
The present sequence is that of cDNA corresponding to a minor transcript of the human calpain 10 gene, CAPN10 (see AA27475).
The sequence contains an open reading frame that encodes a protein of 444 amino acids (see AAY9571), designated calpain 10e. The calpain splicing generates proteins of 672, 544, 517, 513, 444, 274, 139 and 138 amino acids (see AAY99567-74), designated calpain 10a to 10h, respectively. Calpain 10e is encoded by exons calpain 10a to 10h, respectively. Calpain 10e is encoded by exons 110* and 11:13 of the gene. The invention concerns the identification of genes responsible for type 2 diabetes for use in diagnostic and therapeutic applications. A G-to-A polymorphism in clark of the CAPN10 gene in the NIDDMI region of chromosome 2 (UCSNP-43) shows evidence for linkage to type 2 diabetes are methods for screening for a propensity for type 2 diabetes are concerned on detection of a polymorphism in a calpain encoding nucleic acid, especially UCSNP-10 of the CAPN10 gene. Methods are also claimed for: producing calpain 10 polypeptides using calpain 10 polypeptides using calpain 10 polypeptides and nucleic acids; and using the present sequence; identifying modulators of calpain activity using calpain 10 polypeptides and nucleic acids; and using these modulators to treat diabetes, in particular through the regulation of an insulin secretory response or insulin mediated glucose transport.
                                                                                                                                                                                                                                                                   Method for screening for type 2 diabetes mellitus comprises polymorphism in a calpain encoding nucleic acid segment or a protease-encoding nucleic acid segment -
                                                                                                                                                                                                                                                                                                                                                          Claim 65; Page 229-230; 257pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ~
```

The present sequence is that of cDNA corresponding to a minor transcript of the human calpain 10 gene, CAPN10 (see AAZ27475).

The sequence contains an open reading frame that encodes a protein of 513 amino acids (see AAX79570), designated calpain 10d. The CAPN10 gene consists of 15 exons spanning 32 kb. A complex pattern conflict a splicing generates proteins of 672, 544, 517, 513, conflict and the splicing generates proteins of 672, 544, 517, 513, conflict and the splicing acids (see AAX79567-74), designated calpain 10a to 10h, respectively. Calpain 10d is encoded by exons conflict and 11-13 of the gene. The invention concerns the dentification of genes responsible for type 2 diabetes for use in chargonstic and therapeutic applications. A G-to-A polymorphism in control of the CAPN10 gene in the NIDDM1 region of chromosome 2 (UCSNP-43) shows evidence for linkage to type 2 diabetes. Claimed contents are

Claim 65; Page 227; 257pp; English.

based on detection of a polymorphism in a calpain encoding nucleic acid, especially UCSNP-10 of the CAPN10 gene. Methods are also claimed for: producing calpain 10 polypeptides using calpain 10-encoding polymucleotides, including the present sequence; identifying modulators of calpain activity using calpain 10 polypeptides and nucleic acids; and using these modulators to treat diabetes, in particular through the regulation of an insulin secretory response or insulin mediated glucose transport.

The present sequence corresponds to the major transcript of the course CARNIO gene encoding calpain 10 (see AAY79575), a novel cysteine protease. Calpain is ubiquitously expressed in mouse and the cysteine protease. Calpain is ubiquitously expressed in mouse and chumans. The invention concerns the identification of genes cresponsible for type 2 diabetes for use in diagnostic and therapeutic applications. A polymorphism in intron 3 of the human characteristic capplications. A polymorphism in intron 3 of the human characteristic capplications. A polymorphism in a calpain capped to the capped the concerns the polymorphism in a calpain cencoding nucleic acid. Methods are also claimed for: producing calpain 10 polypeptides using calpain 10-encoding polynucleotides, calpain 10 polypeptides using calpain 10-encoding modulators of calpain cactivity using calpain 10 polypeptides and nucleic acids; and using these modulators to treat diabetes, in particular through the regulation of an insulin secretory response or insulin mediated
                                                                                                                                                                                                                                                                                                                                                                                                                      glucose transport.
                                                                                                                                                                                                                                                                                                                                                                                   Claim 65; Page 236-237; 257pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated, enriched, or purified protease polypeptide (I) and polynucleotide (II) encoding (I). (I) may be used to screen for substances (S) that may modulate its activity. Administering S (which modulates protease activity in vitro) may be used to treat a disease or disorder selected from cancers (e.g., of tissues, of blood or haematopoietic origin, of the breast, colon, lung, prostrate, cervical, brain, ovarian, bladder or kidney), immune-related diseases and disorders, cardiovascular disease, brain or neuronal-associated diseases (e.g., central or peripheral nervous system diseases, migraine, pain, sexual dysfunction, mood disorders, attention disorders, cognition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          disorders, hypotension, hypertension, psychotic disorders, neurological disorders and dyskinesias), metabolic disorders and inflammatory disorders (I) may also be useful as a diagnostic tool for a disease or disorder such as those above. AAS97159-AAS97195 represent human protease coding sequences and primers of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel protease polypeptide useful for screening for substances that may be used to treat, e.g., cancers, immune-related diseases, cardiovascular disease, migraine, pain, psychotic and inflammatory

diagnosing, treating seven-transmembrane protein/receptor-related disorders and to identify modulators of therapeutic use New calpain-like protease polypeptides and polynucleotides for

Claim 1; Fig 1; 114pp; English

The invention relates to polypeptide and polynuclectide of calpain-like protease, 18036. The polypeptide and polynuclectide of the invention are useful for treatment and diagnosis of calpain-like protease-mediated disorders. These disorders include disorders of spleen (e.g. disopathic inflammatory bowel disease), liver (e.g. jaundice), colon (e.g. idiopathic inflammatory bowel disease), liver (e.g. jaundice), care include meningitis, Alzheimer's disease), T-cells (e.g. transplant disease, acute meningitis, Alzheimer's disease), P-cells (e.g. transplant rejection, systemic lupus erythematosus), skin (e.g. seborrhoeic rejection, atherosclerosis), kidney (e.g. acute proliferative (myocardial infarction, atherosclerosis), kidney (e.g. acute proliferative glomerulonephritis, urolithiasis), thymus, breast, testis, uterus, small intestine, disorders related to reduced platelet number, bone, covary, pain and infectious disorders. The molecules of the invention are also useful for diagnosing and treating disorders associated with perturbed cellular growth and differentiation, exercise-induced injury and repair, apoptosis, ischaemia, neurodegenerative diseases, demyelinating diseases including experimental allergic encephalomyelitis (EAE) and multiple solerosis, LGMD2A muscular dystroph, spinal cord injury, proliferative and differentiative diseases including experimental allergic encephalomyelitis chromosome of petworen minimizers in and protease, 18036 cDNA. The 18036 gene is located on chromosome of petworen man and petworen man and man an chromosome 2 between D2S140 and D2S2338

The sequence contains an open reading frame that encodes a protein of 517 amino acids (see AAY79569), designated calpain 10c. The CAPN10 gene consists of 15 exons spanning 32 kb. A complex pattern of alternative splicing generates proteins of 672, 544, 517, 513, 444, 274, 139 and 138 amino acids (see AAY79567-74), designated calpain 10a to 10b, respectively. Calpain 10c is encoded by exons 1-7 and 11-13 of the gene. It is readily detectable in many tissues, including skeletal muscle and islets. The invention of concerns the identification of genes responsible for type 2 diabetes for use in diagnostic and therapeutic applications. A G-to-A polymorphism in intron 3 of the CAPN10 gene in the NIDBM1 region of convenes are based on detection of a polymorphism in a calpain condition much are also claimed for: producing for a propensity for type 2 diabetes are based on detection of a polymorphism in a calpain condition are also claimed for: producing calpain 10 polypeptides using calpain 10-encoding polymorlectides, including the present sequence; identifying modulators of calpain activity using calpain 10 polypeptides and nucleic acids; and using these modulators to treat diabetes, in particular through the regulation of an insulin secretory response or insulin mediated glucose transport.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  134 rgLeuCysPheSerArgCysGlnArgGluAspValPheTrpLeuProLeu 150

The present invention describes primer sets for synthesising 5602
full-length cDNAs defined in the specification. Where a primer set
comprises: (a) an oilgo-dT primer and an oilgouncleotide complementary
to the complementary strand of a polynucleotide which comprises one of
the 5602 nucleotide sequences defined in the specification, where the
oilgonucleotide comprises at least 15 nucleotides; or (b) a combination
of an oilgonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oilgonucleotide comprising a sequence; complementary to a
polynucleotide which comprises a 1'-end sequence; where the
polynucleotide which comprises at least 15 nucleotides and the combination of
the 5'-end sequence, 3'-end sequence; where the
coligonucleotide which comprises at least 15 nucleotides and these defined in
the specification. The primer sets can be used in antisense therapy and
in gene therapy. The primers are useful for synthesising polynucleotides,
con particularly full-length cDNAs. The primers are also useful for the
detection and/or diagnosis of the abnormality of the proteins encoded by
control of the full-length cDNAs. The primers are also useful for the
control of the full-length cDNAs. The primers allow obtaining of the full-length
control of AAH13631 to AAH13632
control of the primers allow obtaining of the full-length
control of the primers all of which are used in the exemplification
of the present thuman amino acid sequences; and AAH13632
                                                                                                                                                                                                                                                                                                                               Primer sets for synthesizing polynucleotides, particularly the full-length cDNAs defined in the specification, and for the detand/or diagnosis of the abnormality of the proteins encoded by full-length cDNAs -
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 8; SEQ ID 16542; 2537pp + CD ROM; English.

The present sequence is that of a 49,136 bp region located within the NIDDM1 region of human chromosome 2. It includes the CAPNIO gene that encodes a novel calpain-11ke cysteine protease, designated calpain 10, and a gene encoding a G protein coupled receptor.

C GPR35. Alternative splicing of calpain 10 mRNA generates a family of proteins. Isoforms 10a-h (see AAY79567-74) are respectively concoded by exons 1-7,9-13, 1-7,11-13, 1-7,11-13, 1-7,11-13, 1-7,11-13, 1-7,11-13, 1-7,9-11-13, 1-7,9-11-13, 1-7,9-13, 1-7,9-13, 1-7,2-14,15 and 1,11-13. Calpain 10 mRNA is ubiquitously expressed; the major 2.7 kb transcript was detected in very human adult and foetal tissue examined. Mutations in the CAPNIO gene are responsible for susceptibility to type 2 diabetes. The nucleotide variant showing all the evidence for linkage to type 2 diabetes. There is alternative splicing of intron 3, but the molecular mechanism by which the polymorphism at UCSNP-43 affects susceptibility to type 2 diabetes in unclear. Claimed methods for screening for a propensity for type 2 diabetes mellitus are based. Susceptibility to type 2 diabetes in unclear. Claimed methods for screening for a propensity for type 2 diabetes are based. Con detection of a polymorphism in a calpain encoding nucleic acid, for identifying modulators of calpain activity using calpain 10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Method for screening for type 2 diabetes mellitus comprises detecting polymorphism in a calpain encoding nucleic acid segment or a protease-encoding nucleic acid segment -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI: 2000-339702/29.

Claim 1; SEQ ID 838; 2537pp + CD ROM; English.

The present invention describes primer sets for synthesising 5602 CC full-length cDNAs defined in the specification. Where a primer set CC comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of CC the 5602 nucleotide sequences defined in the specification, where the CC oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the CC complementary strand of a polynucleotide which comprises a 5'-end complementary to a c particularly full-length cDNAs. The primers are also useful for synthesising polynucleotides, detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the proteins encoded by

cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonuclectides, all of which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             244
